RPA Case

CIPHIX

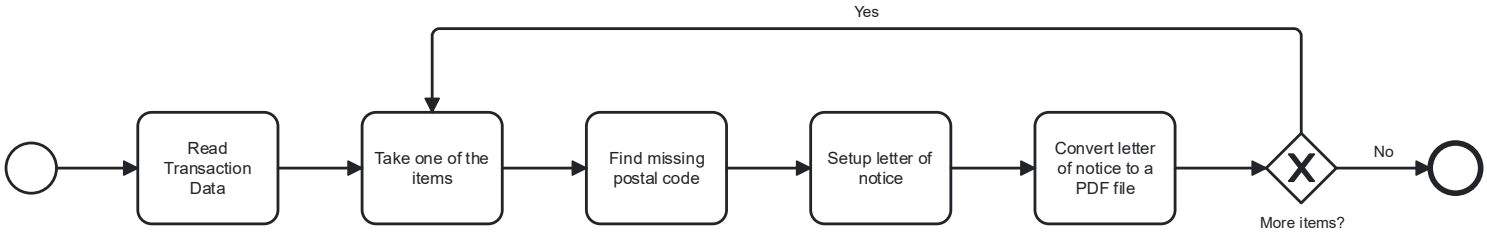
Hi there and welcome to the Ciphix RPA case! In this brief, we will present you with a short RPA use case, after which you will build a small robot in UiPath of your own to solve the case. Be as creative as you want with this! As with most RPA cases, there is not just one solution or one correct way to go about this case. That being said, let's dive in!

Case Description

Ciphix Air transports over 30 million passengers each year to many destinations worldwide. When passengers enter the aircraft, they have often already activated their holiday mode. This results in forgetting a variety of items from headphones to tablets or other electronic devices. Ciphix Air has an extensive focus on customers and thus has a mission to try and return all lost/missing items to their rightful owner. Flight attendants or cleaners find these lost items and often infer the owner of the lost item.

As more than 6,000 items are lost on daily basis, Ciphix Air has almost fully automated the process of sending a letter of notice (LoN) to the passengers indicating that a lost item has been found and it is likely theirs. Yet, sometimes there are exceptions in this process caused by missing information. For instance, when a flight is booked through a particular large booking platform, a postal code is not included in the booking.

In this automation assignment, you'll be asked to resolve this exception to assure the LoN is still being sent and the rightful owner has the opportunity to claim his/her lost item.



Case To-Do's

The automation should contain the following elements:

- Import the Excel information into UiPath and clean the input data.
  - Use the Excel file "InputTransactionData.xlsx"
- Find the missing PostalCode
  - Use https://www.postnl.nl/postcode-zoeken/ to collect the PostalCode by filling in the StreetName, HouseNumber and CityName.
- Fill in the Letter of Notice (LoN)
  - Use the word template "letterofnotice.docx"
  - Template contains "bookmarks" such that the template can be filled in.
  - Hint: Check the Microsoft Word activities.
  - (If you want you can always use other inventive ways to do this)
- Convert the letter to PDF
  - Store the letters in a folder
  - The PDF files should be named "LetterOfNotice_{LastName}_{FirstName}.pdf"

Submission

Save all your used files and Zip your submission including the folder with output files into the following naming format:
"Ciphix_UiPathDevAssignment_{LastName}_{date}.zip"

Then send your submission ton your person of contact.
